HANSHIN ENGINEERING Co., Ltd.

The Most Advanced Aerator and Agitator in the World Hanshin Aquarator

The Hanshin Aquarator is the original aerator and agitator and it is also
the pinnacle of the technology.

Since the invention of the world's first, energy conserving
aerating/agitating equipment in 1975, Hanshin has continued to provide
technological innovations to pioneer a new future for people and water.

The Hanshin Aquarator is the embodiment of these ideas and technology
at their highest levels.

AQUARATOR®

More than 10,000 units to 1,000 processing locations.

Across Japan and other countries including Taiwan, Korea, China, Thailand, Malaysia, and Philippines.

The Aquarator has advanced the benchmark value of aerator/agitator equipment through its use in numerous locations.

Ideas that don't change with time, technological advancements that are ahead of their times.

The true ideals of aerator/agitator equipment can be seen in the Hanshin Aquarator.

Application examples

Public facilities

- **Wastewater treatment plants**
Wastewater treatment plants for sewerage treatment, night-soil treatment, community sewerages
- **River purification facilities**
Headrace channels and cleaning vessels
- **Water purification facilities**
Water purifying plants

Private facilities

- **Industrial wastewater treatment facilities**
Wastewater treatment plants for food, beverage, beer, wine, sake, fishery processing, stock farming, meat processing, sugar processing, starch processing, oils and fats, palm oil, latex, paper, petroleum, chemical products, textile, dyeing, paint production, pharmaceutical production, supermarket, roadside rest area, medical center, waste dump

The highest standards and performance in the industry

By separating the power sources for the aerating and agitating functions, the Aquarator can easily conform to any changes in load, eliminate wasteful energy consumption and has made possible drastic reductions in water processing costs.

Aeration over long distances and wide areas with an oblique flow discharge

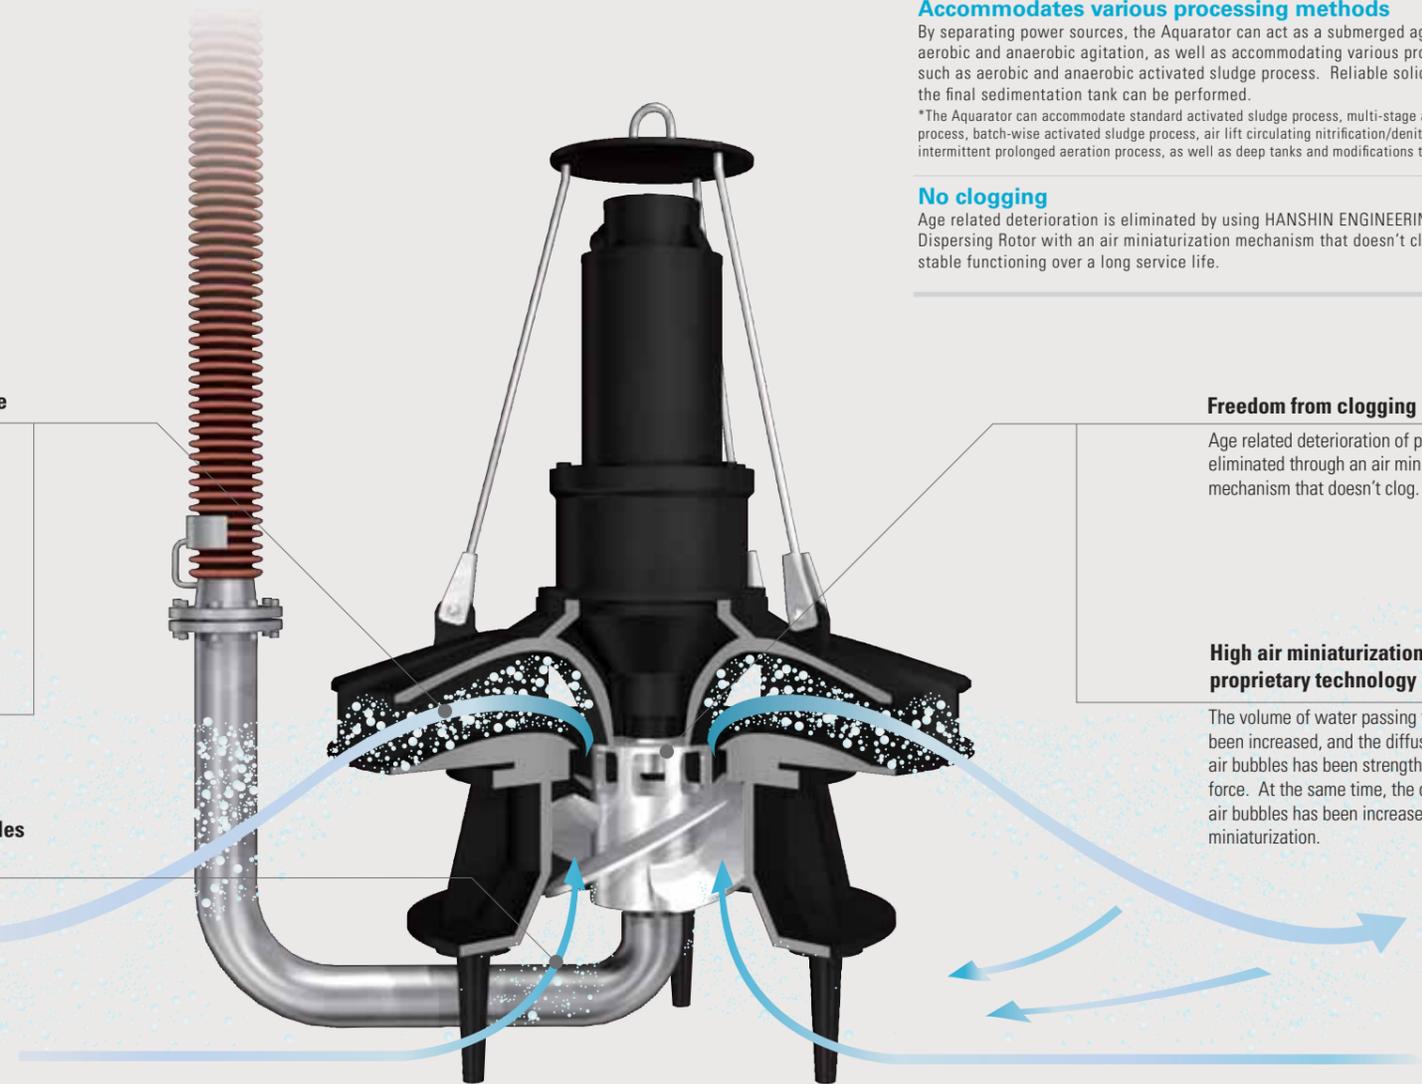

By lowering the discharge angle, the discharge is now an oblique flow discharge. Thanks to this, the microbubble compound liquid can be carried further, the water flow circulation is increased, and has made possible aeration in even the deepest sections of water.

Increased discharge strength through petal-shaped segmentation

By segmenting the water discharge route into petal shapes, discharge strength has been significantly increased.

Bottom inflow increases the time air bubbles are contained within the tank

The natural flow of air and water dramatically increases power efficiency. In addition, by generating bottom inflow strength, water is sucked into the bottom of the tank without separation and surfacing of the air bubbles, and forces entrainment with the water flow. Through this, the time the air bubbles are contained within the tank is increased.

Realization of extremely high energy efficiency

By separating the power sources for the functions of supplying air and aeration/agitation to create rational submerged equipment, energy efficiency is drastically increased by being able to arbitrarily control both functions at the same time, or each function separately.

Easy maintenance

Due to its simple design, maintenance can be performed on-site. This also dramatically decreases the time required for maintenance. In addition, because the Aquarator is simply placed along a guide pipe, water draining is not required when installing or removing the Aquarator.

Accommodates various processing methods

By separating power sources, the Aquarator can act as a submerged agitator for both aerobic and anaerobic agitation, as well as accommodating various processing methods such as aerobic and anaerobic activated sludge process. Reliable solid-liquid separation in the final sedimentation tank can be performed.

*The Aquarator can accommodate standard activated sludge process, multi-stage aerobic and anaerobic process, batch-wise activated sludge process, air lift circulating nitrification/denitrification process, intermittent prolonged aeration process, as well as deep tanks and modifications to the installed tank.

No clogging

Age related deterioration is eliminated by using HANSHIN ENGINEERING's proprietary Air Dispersing Rotor with an air miniaturization mechanism that doesn't clog. This provides stable functioning over a long service life.

Freedom from clogging

Age related deterioration of performance is eliminated through an air miniaturization mechanism that doesn't clog.

High air miniaturization through proprietary technology

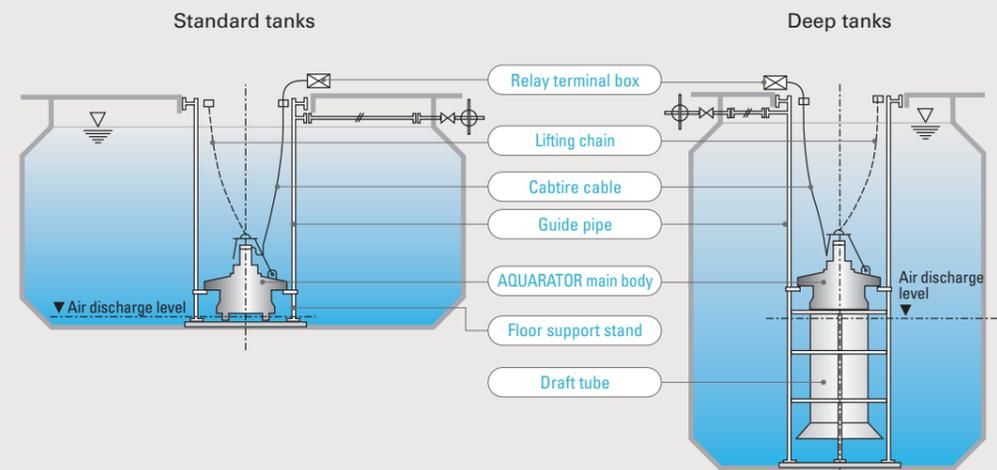

The volume of water passing through the body has been increased, and the diffusion strength of the air bubbles has been strengthened by centrifugal force. At the same time, the contact area of the air bubbles has been increased through air bubble miniaturization.

*Agitation functions have been improved through design changes.

A submerged aerobic and anaerobic aerator/agitator that accommodates numerous processing methods

The Aquarator can flexibly accommodate numerous processing methods.
 Freely choose installation methods depending on the provided environment.
 The Aquarator can change shape according to the shape of the tanks and consistently provides the highest level of performance.

Overall configuration

The Aquarator separates the power sources for the 2 main functions for aeration which are the supplying of air and agitation/aeration. By creating rational submerged equipment for the latter, the energy efficiency of aeration has been greatly increased. [Ministry of Construction (Current Ministry of Land, Infrastructure, Transport and Tourism) Technology Assessment No. 81102]

By separating the control factors for the air supply function and the aeration/agitation functions, the Aquarator can act as a submerged agitator for both aerobic and anaerobic agitation, as well as being able to easily select between various processing methods such as standard activated sludge process, aerobic and anaerobic activated sludge process, intermittent prolonged aeration process, batchwise process.

The separation of the control factors (power source) means the Aquarator can easily accommodate changes in water processing conditions and processing methods in an energy efficient manner. Depending on the circumstances and purpose, the unit can use either the air supply function (blower) or the aeration/agitation functions (Aquarator) separately or both controlled arbitrarily to be able to perform appropriate processing even under heavy loads.

Transitioning from traditional aeration equipment

The Aquarator can flexibly accommodate different tank shapes and operational methods for reliable processing. The Aquarator, which is for both anaerobic and aerobic use can not only act as aeration equipment, but its capabilities also fully shine as an agitator as well. The Aquarator can also be used as reinforcing agitator for other aeration equipment. The Aquarator can solve various problems such as low levels of DO (Dissolved Oxygen) in the tanks as well as reduced functionality due to accumulation of sediment and clogging.

Transition from Surface Aerators

<p>Surface Aerator</p> <p>Lack of agitation at bottom of tank</p> <ul style="list-style-type: none"> • Sedimentation of sludge • Reduction of tank volume • Reduction of aeration time • Reduction of processing capabilities • Rost and stink occurs • The tank bottom becomes hypoxia easily <p>Dispersion of sewerage mist</p> <p>The mechanism design makes dispersion of sewerage mist unavoidable</p>	<p>Aquarator</p> <p>Guide pipe</p> <p>Blower</p>	<p>Complete integrated agitation possible</p> <p>Accurately and reliably supplies oxygen to efficiently aerate the tank and improve tank DO levels.</p> <p>Since aeration is performed in the water, there is no need to worry about water spray, noise or foul smells.</p> <p>Uniform agitation within the tank as well as the surface is possible. There is also no accumulation of sediment.</p> <p>The Aquarator also has no problems with deep tanks that surface aerators find difficulty with.</p>
<p>Movable Aquarator</p> <p>Blower</p>		

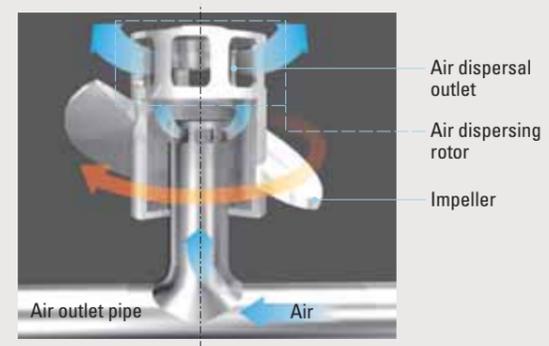

Transition from Diffuser Pipes, Diffuser Tubes, and Diffusion Plates

<p>Diffuser pipe / Diffuser tube / Diffusion plate</p> <p>Sedimentation of sludge</p> <ul style="list-style-type: none"> • Because of a swirling flow of air bubbles, the flow velocity is attenuated in areas at the bottom of the tank which are furthest away from the outlet, making it easier for sediment to accumulate <p>Progression of clogging</p> <ul style="list-style-type: none"> • Clogging progresses when the volume of air decreases following a change in load • Clogging due to inverted pressure when aeration is stopped 	<p>Aquarator</p> <p>Guide pipe</p>	<p>Reliable aeration and agitation with the Aquarator</p> <p>High power aeration and agitation even at the bottom of the tank so that there is no accumulation of sediment</p> <p>Turbulent flows are generated by the strong outlet flow from the Aquarator. Larger amounts of oxygen can be dissolved since the air bubbles last longer.</p> <p>Clogging does not occur because of stoppage of aeration in intermittent processes or when the volume of air decreases.</p>
<p>Movable Aquarator</p>		

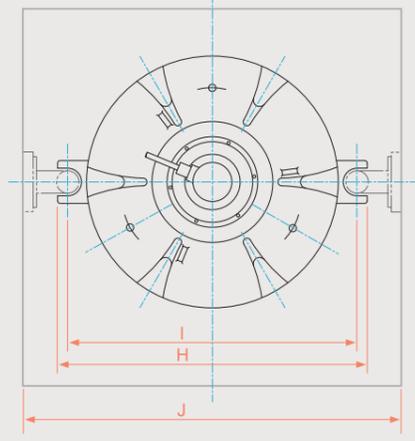

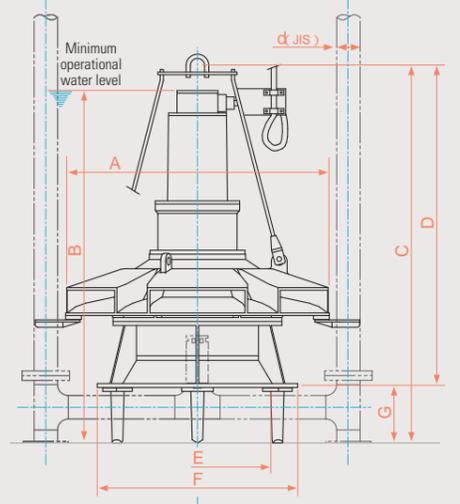

High rigidity that supports unsurpassed aeration/agitation functions and a body that produces superior water flow

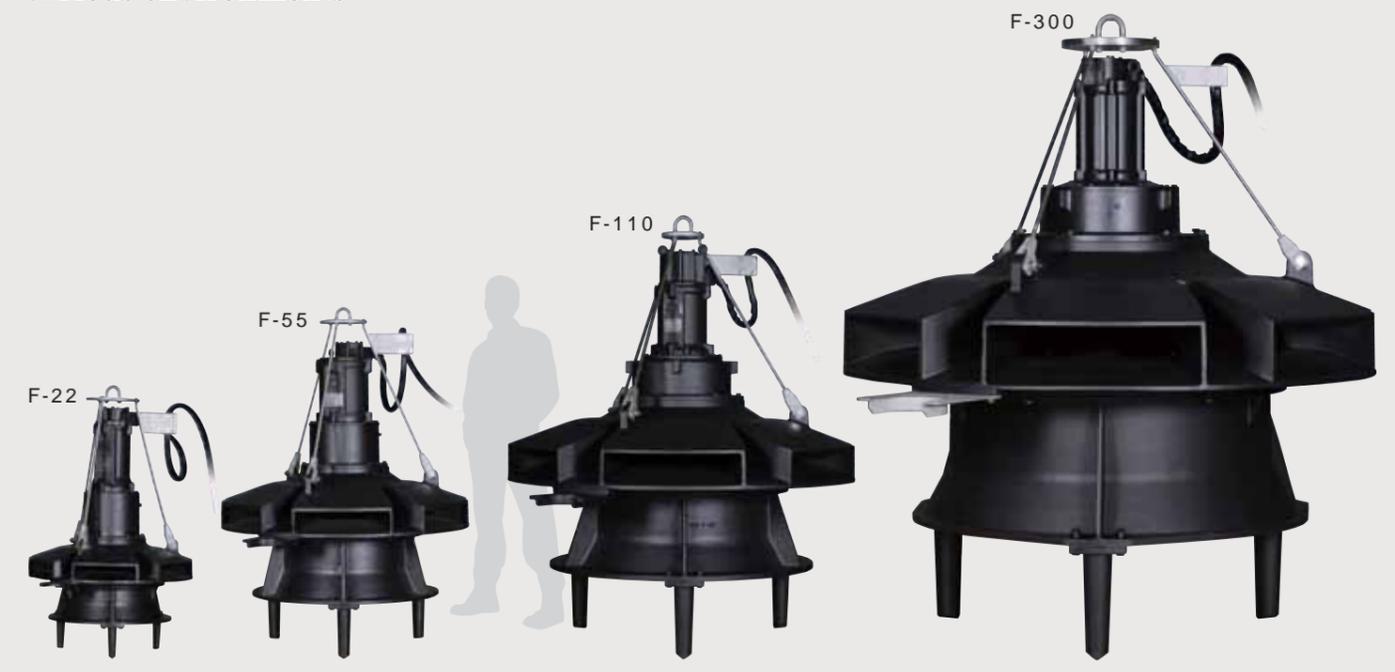

Custom developed air miniaturization mechanism, the "Air Dispersing Rotor"

*The displayed oxygen transfer rates are for when the reference installation water depth is 5.0m.
*Please consult HANSHIN ENGINEERING for voltage other than these above.

Unparalleled standard performance, realizing stable aeration performance

When selecting a model, the number of units and air flow volume, both the agitation and the oxygen supply capabilities within the tank needs to be satisfied. In regards to oxygen supply capability, the design requirements for Actual Oxygen Requirement (AOR) of the compound liquid within the tank is calculated at 20°C and adjusted for freshwater condition values. The Standard Oxygen Transfer Rate (SOTR), required by the submerged aeration/agitation equipment, is then determined and an appropriate model with the appropriate air flow volume is selected from the capability chart.

Regarding agitation capability

Agitation capability refers to the water flow generation capability required to sustain the mixed suspension of activated sludge. The required power output for each tank is calculated and the smallest appropriate model is selected.

<p>Case A</p>	$V = L \times W \times H \text{ (m}^3\text{)}$	<p>L / W</p> <p>Design standard value *1</p> <p>Required agitation power density $P_d \text{ (kW/m}^3\text{)}$</p> <p>Standard tank / Deep tank *2</p>
<p>Case B</p>	<p>When $L1 > L2$</p> $L = 2 \times L1 \text{ (} L1 > L2 \text{)}$ $V = L \times W \times H \text{ (m}^3\text{)}$	
<p>Required power output $P_r = P_o \times V \text{ (kW)}$</p>		

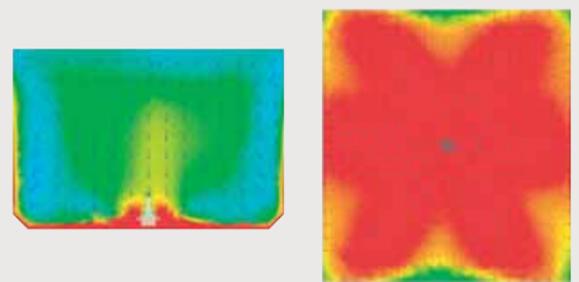

*1 Design standard values are for sewerage/reaction tanks.
*2 Deep tanks are those with draft tube specifications.

Selection examples that are outside selection condition ranges

Example 1 Standard tank

Model: F-22 Aquarator (2.2kW)

Tank size: 9m (length) x 9m (width) x 6m (depth) ($P_o = 4.5\text{W/m}^3$)

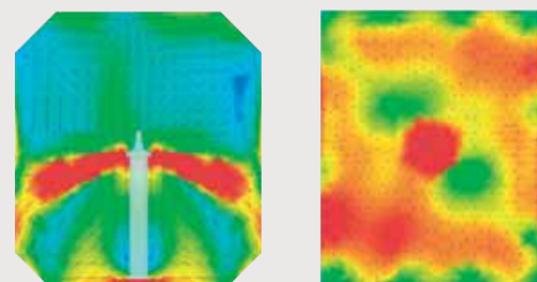

Average flow speed (m/sec)
Cross sectional flow speed in center of unit / flow speed at base of unit

Example 2 Deep tank

Model: F-37 Aquarator (3.7kW)

Tank size: 9m (length) x 9m (width) x 10m (depth) ($P_o = 4.6\text{W/m}^3$)

Average flow speed (m/sec)
Cross sectional flow speed in center of unit / flow speed at base of unit

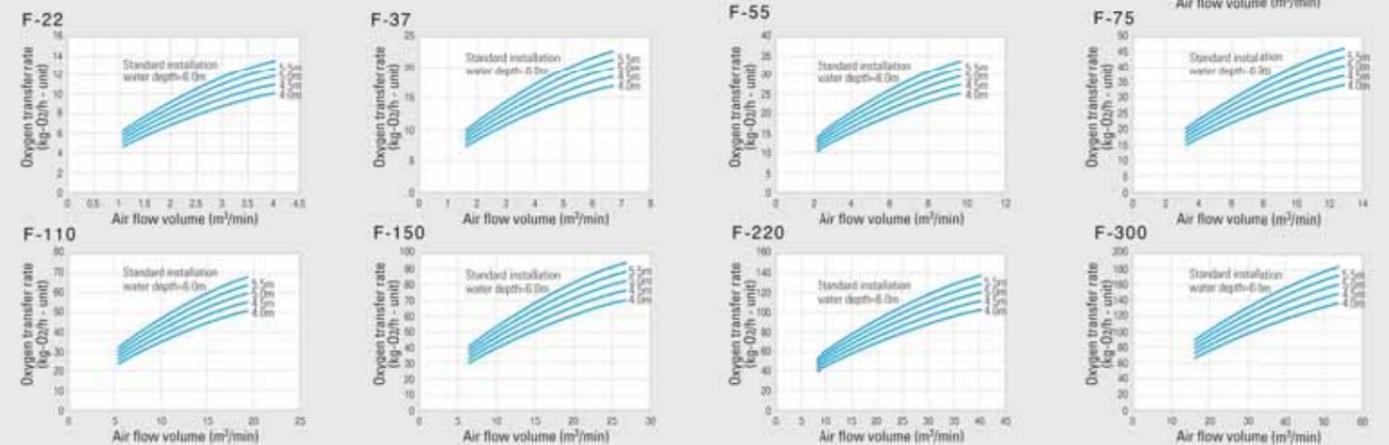

*If there are joists or columns in the tank, the required agitation power density may differ (depending on the installation location of the equipment).
*Please contact HANSHIN ENGINEERING if there are any large decentralizations of equipment installation location or if the selection conditions do not match.

Oxygen transfer capability chart When operating on commercial electrical power

The following charts illustrate oxygen transfer rates during commercial operation (freshwater 20°C, MLDO=0mg/L)

*When selecting air flow volume, please do so while including some leeway as oxygen transfer rates can fluctuate approximately 10% depending on water temperature, tank shape/size and inflowing water substrates.

*The standard installation water depth is based on the distance from the water surface to unmoving parts of the equipment (bottom of lower casing).

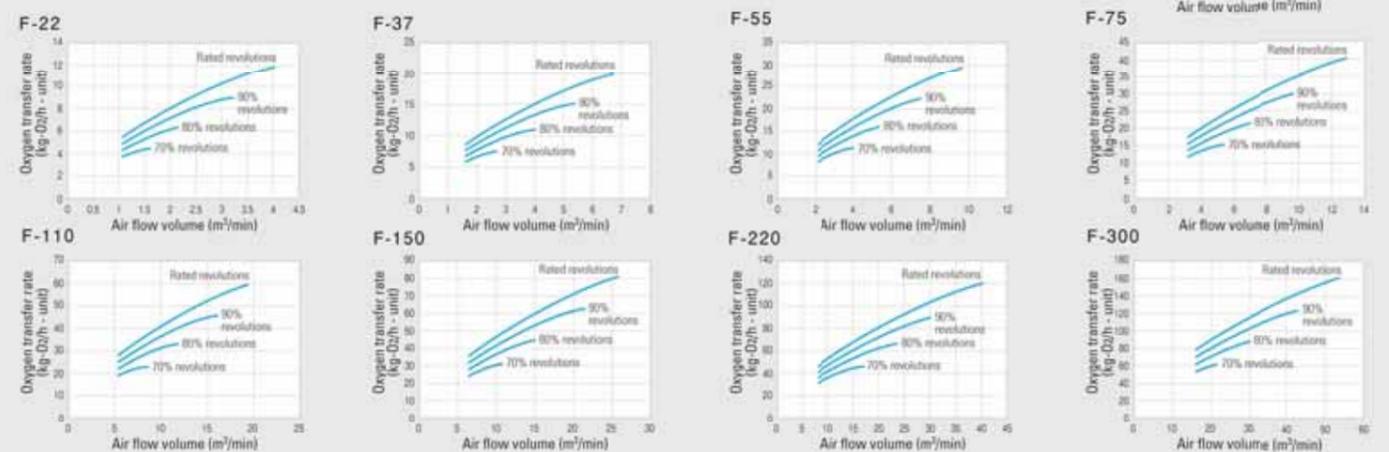

Oxygen transfer capability chart When operating on VVVF

The following charts illustrate oxygen transfer rates when operating with revolution restrictions using a frequency converter at a standard installation water depth of 5.0m (freshwater 20°C, MLDO=0mg/L).

*"Rated revolutions" is the oxygen transfer rate while operating on commercial electrical power.

*Please use the following constants when performing calculations for when the standard installation water depth is other than 5.0m (4.0m - 0.85, 4.5m - 0.93, 5.5m - 1.07, 6.0m - 1.14).

*Air flow volume is for standard conditions (20°C, 101.3kPa, 65%RH).
*Please consult HANSHIN ENGINEERING for water depths other than those above.

For an excellent water environment

Cases of Aquarator application

Regular maintenance and repair

Due to its simple design, maintenance can be performed on-site and time required for maintenance can also be drastically reduced. Because the Aquarator is basically placed along a guide pipe, there is no need for water drainage when installing or removing the Aquarator. Appropriate maintenance cycles vary slightly depending on usage conditions. Please refer to the chart below and use them as a guide to perform maintenance according to the cycle, ahead of schedule if possible. Please note that pulling up the Aquarator from the tank approximately once a year and performing a visual inspection is highly effective in preventing malfunctions and maintaining life span.

Part to be replaced	Recommended replacement cycle	Pertinent part to be replaced				Submerged drive mechanism schematics
		1st time	2nd time	3rd time	4th time	
Water seal cassette (for output shaft)	Every 3 years	○	○	○	○	<ul style="list-style-type: none"> 1 Water seal cassette (for output shaft) 2 Oil seal cassette (for motor shaft) 3 Motor shaft bearings 4 Lubrication gear oil 5 Gears inside gear reducer 6 Bearings inside gear reducer 7 Cabtire cable

Others	Submerged motor	Depends on condition				
	Submerged gear reducer					

*The proposed maintenance cycle above is just for reference. The maintenance cycle is subjected to the actual site condition and is recommended that you consult HANSHIN ENGINEERING about it.
*Please consult HANSHIN ENGINEERING regarding regular maintenance and repair when using the Aquarator intermittently.

Aquarator is suitable for all kinds of applications.

New/Standard Activated Sludge Process

Suitable to the following 4 patterns.

- Pattern I** ○-○-○-○ **Basic Pattern**
- Pattern II** A-O-O-O **Bulking Countermeasures**
- Pattern III** A-A-O-O **Nitrification Control** (ASRT shortened)
- Pattern IV** A-O-A-O **Nitrification Promotion** (Nitrogen removal and BOD high cut down)

Air Lift Circulating Nitrification/Denitrification Process

- Single-Stage Nitrification/Denitrification Process**
- Dual-Stage Nitrification/Denitrification Process**
- Triple-Stage Nitrification/Denitrification Process**

Intermittent Prolonged Aeration Process

24h/day

Excess sludge, Energy saving control, VVVF, AS controller, DO sensor, Auto flow available with ASRT control

Deep Tanks

3-Stage Anaerobic/Aerobic Process

Utilizing air lift circulation at terminal nitrification liquor. High level removal of BOD, nitrogen and phosphorus.

Sequencing Batch Reactor of Activated Sludge Process

1 cycle

Operating pattern I: Aeration/agitation, Settling, Discharge

Operating pattern II: Agitation, Stop, Settling, Discharge

KF Type: Supernatant water discharger

Renovation of Installed Tanks

Bulking solution, nitrification control solution.

Air discharge level

*If air source is shared with other air dispersing equipment, the air intake level should be matched.
